A. L. M. Kooijman, 2000-03-23 The Dynamic Energy Budget theory unifies the commonalties between organisms as prescribed by the implications of energetics and links different levels of biological organisation cells organisms and populations The

theory presents simple mechanistic rules that describe the uptake and use of energy and nutrients and the consequences for physiological organization throughout an organism's life cycle. All living organisms are covered in a single quantitative framework the predictions of which are tested against a variety of experimental results at a range of levels of organisation. The theory explains many general observations such as the body size scaling relationships of certain physiological traits and provides a theoretical underpinning to the method of indirect calorimetry. In each case the theory is developed in elementary mathematical terms but a more detailed discussion of the methodological aspects of mathematical modelling is also included.
