

over and downwind of cities. As the ozone NAAQS is tightened, the regional concentrations approach the desired concentrations, providing very little room for the bump of ozone from individual cities.

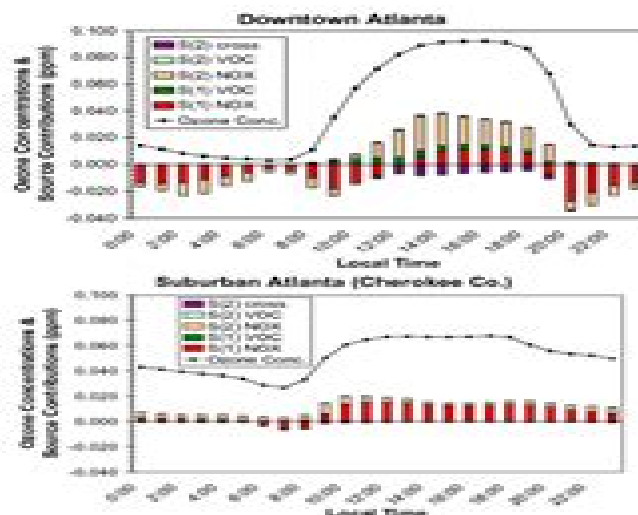

FIGURE 3-4 Simulated ozone concentration and sensitivity of ozone to Atlanta-area NO_x and VOC emissions for downtown Atlanta and a suburban location downwind. Bars in each graph illustrate how much local emissions change ozone concentrations in downtown and suburban Atlanta. Combined red and tan bars show how emissions of NO_x in the Atlanta area affect ozone. If bars are above zero (positive sensitivity), Atlanta NO_x emissions increase ozone in locations shown at that time. If bars are negative, such NO_x emissions lead to decreases in ozone at that location and time. Locally, increased NO_x emissions lead to decrease in ozone (negative sensitivity) through much of day downtown but generally increase ozone downwind in suburban area. VOC emissions increase ozone during daytime downtown (for example, green portion of bars) but have less effect at night and downwind. Gap between ozone concentration and sum of sensitivities shows magnitude of ozone transported from outside area. Reducing local NO_x emissions can decrease ozone peak but actually lead to an increase in 24-h average ozone on such a high-ozone day. On lower-ozone days, decreasing local NO_x emissions can increase ozone through more of day. Source: Coban et al. 2005. Reprinted with permission; copyright 2005, American Chemical Society.
