Dynamic Systems Dynamic Systems:

Identification of Dynamic Systems Rolf Isermann, Marco Münchhof, 2010-11-22 Precise dynamic models of processes are required for many applications ranging from control engineering to the natural sciences and economics Frequently such precise models cannot be derived using theoretical considerations alone Therefore they must be determined experimentally This book treats the determination of dynamic models based on measurements taken at the process which is known as system identification or process identification Both offline and online methods are presented i e methods that post process the measured data as well as methods that provide models during the measurement The book is theory oriented and application oriented and most methods covered have been used successfully in practical applications for many different processes Illustrative examples in this book with real measured data range from hydraulic and electric actuators up to combustion engines Real experimental data is also provided on the Springer webpage allowing readers to gather their first experience with the methods presented in this book Among others the book covers the following subjects determination of the non parametric frequency response fast Fourier transform correlation analysis parameter estimation with a focus on the method of Least Squares and modifications identification of time variant processes identification in closed loop identification of continuous time processes and subspace methods Some methods for nonlinear system identification are also considered such as the Extended Kalman filter and neural networks The different methods are compared by using a real three mass oscillator process a model of a drive train For many identification methods hints for the practical implementation and application are provided The book is intended to meet the needs of students and practicing engineers working in research and development design and manufacturing *Inners and Stability of Dynamic Systems* Eliahu Ibrahim Jury, 1982

An Introduction to Dynamical Systems Rex Clark Robinson, 2012 This book gives a mathematical treatment of the introduction to qualitative differential equations and discrete dynamical systems The treatment includes theoretical proofs methods of calculation and applications The two parts of the book continuous time of differential equations and discrete time of dynamical systems can be covered independently in one semester each or combined together into a year long course The material on differential equations introduces the qualitative or geometric approach through a treatment of linear systems in any dimensions There follows chapters where equilibria are the most important feature where scalar energy functions is the principal tool where periodic orbits appear and finally chaotic systems of differential equations The many different approaches are systematically introduced through

examples and theorems The material on discrete dynamical systems starts with maps of one variable and proceeds to systems in higher dimensions The treatment starts with examples where the periodic points can be found explicitly and then introduces symbolic dynamics to analyze where they can be shown to exist but not given in explicit form Chaotic systems are presented both mathematically and more computationally using Lyapunov exponents With the one dimensional maps as models the multidimensional maps cover the same material in higher dimensions This higher dimensional material is less computational and more conceptual and theoretical The final chapter on fractals introduces various dimensions which is another computational tool for measuring the complexity of a system It also treats iterated function systems which give examples of complicated sets In the second edition of the book much of the material has been rewritten to clarify the presentation Also some new material has been included in both parts of the book This book can be used as a textbook for an advanced undergraduate course on ordinary differential equations and or dynamical systems Prerequisites are standard courses in calculus single variable and multivariable linear algebra and introductory differential equations

The Art of Modeling Dynamic Systems Foster Morrison, 2012-03-07 This text illustrates the roles of statistical methods coordinate transformations and mathematical analysis in mapping complex unpredictable dynamical systems It describes the benefits and limitations of the available modeling tools showing engineers and scientists how any system can be rendered simpler and more predictable Written by a well known authority in the field this volume employs practical examples and analogies to make models more meaningful The more universal methods appear in considerable detail and advanced dynamic principles feature easy to understand examples The text draws careful distinctions between mathematical abstractions and observable realities Additional topics include the role of pure mathematics the limitations of numerical methods forecasting in the presence of chaos and randomness and dynamics without calculus Specialized techniques and case histories are coordinated with a carefully selected and annotated bibliography The original edition was a Library of Science Main Selection in May 1991 This new Dover edition features corrections by the author and a new Preface
