**Dynamical Systems by Example** Luís Barreira, Claudia Valls, 2019-04-17

This book comprises an impressive collection of problems that cover a variety of carefully selected topics on the core of the theory of dynamical systems. Aimed at the graduate upper undergraduate level, the emphasis is on dynamical systems with discrete time. In addition to the basic theory, the topics include topological low dimensional hyperbolic and symbolic dynamics as well as basic ergodic theory. As in other areas of mathematics, one can gain the first working knowledge of a topic by solving selected problems. It is rare to find large collections of problems in an advanced field of study, much less to discover accompanying detailed solutions. This text fills a gap and can be used as a strong companion to an analogous dynamical systems textbook such as the authors' own *Dynamical Systems*. Universitext, Springer, or another text designed for a one or two semester advanced undergraduate graduate course. The book is also intended for independent study. Problems often begin with specific cases and then move on to general results following a natural path of learning. They are also well graded in terms of increasing the challenge to the reader. Anyone who works through the theory and problems in Part I will have acquired the background and techniques needed to do advanced studies in this area. Part II includes complete solutions to every problem given in Part I, with each conveniently restated. Beyond basic prerequisites from linear algebra, differential and integral calculus, and complex analysis, and topology, in each chapter the authors recall the notions and results without proofs that are necessary to treat the challenges set for that chapter, thus making the text self-contained.

*Synergetics* A. Pacault, C. Vidal, 1979-02

This volume gathers most of the lectures and communications presented at the meeting held in Bordeaux from the 27th to the 29th of September and entitled *Far from equilibrium instabilities and structures*. This meeting is part of a series of several other interdisciplinary conferences such as Elmau 1972, London 1974, Dortmund 1976, Elmau 1977, Tokyo 1978. The old science classification scheme proposed by Auguste Comte tends to be every day a bit more blurred out; one gives here, if needed, one additional illustration of this trend. The three key words *far from equilibrium*, *instabilities*, and *structures* best illustrate the new concepts which emerge from the description of the dynamics of various systems relevant to many different research areas: Laser emission, chemical reactions, fluid motions exhibit very particular phenomena when under appropriate external action they occur far from equilibrium. These proceedings include the experimental description of such phenomena as well as theoretical attempts in understanding them. Most of the topics investigated here belong to the domains of physics and chemistry, but one should be careful not to underestimate the underlying potential biological interest. If the study of simple systems, e.g. described by a few variables, has been quite successful for several centuries, the recent bearing of our attention on complex systems constitutes a genuine epistemological breakthrough bridging the gap which used to exist between the sciences and the humanism.
