Bi-Manual Collaborative Robot José Agustín Aguilar Plazaola, 2016 This project presents the application of a visual servo  
 control to an industrial human like robot both using a simulation environment and in a real platform In a visual servo scheme  
 the control loop is closed by a vision sensor usually a camera or more than one in the stereo approach The camera acquires  
 the image of a defined target and a control algorithm calculates the relative pose of robot target and then continuously sends  
 commands to the robot in order to position it as required The pose calculation and controller algorithms have been written in  
 C The work has been carried out through a sequence of stages that are presented in this document The first part goes  
 through the basic theoretical ideas that support the design of the visual servo It is composed of three main areas computer  
 vision which deals mostly with the implementation of the vision sensor robot kinematics which allows define the equations  
 that describe time evolution of the robot position orientation speed and joints values and finally the merge of both areas the  
 visual servo itself that makes up the control loop A next section explains how the different tools and frameworks have been  
 used to implement the control loop Some of these tools are manufacturer proprietary programs others are open source There  
 is a detailed description of how the simulation environment is set the content of each of the blocks in the control loop and a  
 basic explanation of the manufacturers program The results show how the robot simulated and real converges to the relative  
 set point pose and is also able to track changes in the position and orientation of the target      Operation, Programming and
