run applications by using containers Containers allow a developer to package up an application with all of the parts it needs  
such as libraries and other dependencies and ship it all out as one package By doing so thanks to the container the developer  
can rest assured that the application will run on any other Linux machine regardless of any customized settings that machine  
might have that could differ from the machine used for writing and testing the code Docker is a tool that is designed to  
benefit both developers and system administrators making it a part of many DevOps developers operations toolchains For  
developers it means that they can focus on writing code without worrying about the system that it will ultimately be running  
on It also allows them to get a head start by using one of thousands of programs already designed to run in a Docker
