## **Effects Of Noisy Patterns In Some Areas Of Visual Research:**

*Effects of Noisy Patterns in Some Areas of Visual Research* Werner, Johannes Henricus Werner, 1983\* **Effects of Noisy Patterns in Some Areas of Visual Research** Johannes Henricus Werner, 1983 Technical Report Human Resources Research Organization, 1968 Mental Health Research Institute Staff Publications University of Michigan. Mental Health Research Institute, 1969 **Neural Mechanisms of Perceptual Categorization as Precursors to Speech Perception** Einat Liebenthal, Lynne E. Bernstein, 2017-05-03 Perceptual categorization is fundamental to the brain's remarkable ability to process large amounts of sensory information and efficiently recognize objects including speech. Perceptual categorization is the neural bridge between lower level sensory and higher level language processing. A long line of research on the physical properties of the speech signal as determined by the anatomy and physiology of the speech production apparatus has led to descriptions of the acoustic information that is used in speech recognition e.g. stop consonants place and manner of articulation voice onset time aspiration. Recent research has also considered what visual cues are relevant to visual speech recognition i.e. the visual counter parts used in lipreading or audiovisual speech perception. Much of the theoretical work on speech perception was done in the twentieth century without the benefit of neuroimaging technologies and models of neural representation. Recent progress in understanding the functional organization of sensory and association cortices based on advances in neuroimaging presents the possibility of achieving a comprehensive and far reaching account of perception in the service of language. At the level of cell assemblies research in animals and humans suggests that neurons in the temporal cortex are important for encoding biological categories. On the cellular level different classes of neurons interneurons and pyramidal neurons have been suggested to play differential roles in the neural computations underlying auditory and visual categorization. The moment is ripe for a research topic focused on neural mechanisms mediating the emergence of speech representations including auditory visual and even somatosensory based forms. Important progress can be achieved by juxtaposing within the same research topic the knowledge that currently exists the identified lacunae and the theories that can support future investigations. This research topic provides a snapshot and platform for discussion of current understanding of neural mechanisms underlying the formation of perceptual categories and their relationship to language from a multidisciplinary and multisensory perspective. It includes contributions reviews original research methodological developments pertaining to the neural substrates dynamics and mechanisms underlying perceptual categorization and their interaction with neural processes governing speech perception. **Visual Detection, Identification, and Localization** Bernard Lyman, 1968 The literature survey was undertaken to explore information on the nature of and conditions for effective visual perception at low light levels. From the survey 407 reports or studies were selected for inclusion in the annotated bibliography. With a few exceptions the material falls within the areas of detection identification and localization. Many laboratory studies are included which could undergo appropriate modification for

repetition in natural settings at low light levels In each annotation the purpose and the results or conclusions of the study are stated method and procedure are indicated only briefly Author     *Effects of Target Size Variation on Skill Acquisition* ,1954

*Using Noise to Characterize Vision* Rémy Allard,Jocelyn Faubert,Denis G. Pelli,2016-03-02 Noise has been widely used to investigate the processing properties of various visual functions e g detection discrimination attention perceptual learning averaging crowding face recognition in various populations e g older adults amblyopes migrainers dyslexic children using noise along various dimensions e g pixel noise orientation jitter contrast jitter The reason to use external noise is generally not to characterize visual processing in external noise per se but rather to reveal how vision works in ordinary conditions when performance is limited by our intrinsic noise rather than externally added noise For instance reverse correlation aims at identifying the relevant information to perform a given task in noiseless conditions and measuring contrast thresholds in various noise levels can be used to understand the impact of intrinsic noise that limits sensitivity to noiseless stimuli Why use noise Since Fechner named it psychophysics has always emphasized the systematic investigation of conditions that break vision External noise raises threshold hugely and selectively In hearing Fletcher used noise in his famous critical band experiments to reveal frequency selective channels in hearing Critical bands have been found in vision too More generally the big reliable effects of noise give important clues to how the system works And simple models have been proposed to account for the effects of visual noise As noise has been more widely used questions have been raised about the simplifying assumptions that link the processing properties in noiseless conditions to measurements in external noise For instance it is usually assumed that the processing strategy or mechanism used to perform a task and its processing properties e g filter tuning are unaffected by the addition of external noise Some have suggested that the processing properties could change with the addition of external noise e g change in filter tuning or more lateral masking in noise which would need to be considered before drawing conclusions about the processing properties in noiseless condition Others have suggested that different processing properties or mechanisms could be solicited in low and high noise conditions complicating the characterization of processing properties in noiseless condition based on processing properties identified in noise conditions The current Research Topic probes further into what the effects of visual noise tell us about vision in ordinary conditions Our Editorial gives an overview of the articles in this special issue     **Binocular Vision and Stereopsis** Ian P. Howard,Brian J. Rogers,1995 This book is a survey of knowledge about binocular vision with an emphasis on its role in the perception of a three dimensional world The primary interest is biological vision In each chapter physiological behavioral and computational approaches are reviewed in some detail discussed and interrelated The authors describe experiments required to answer specific questions and relates them to new terminologies and current theoretical schemes     **Publications** Mental Health Research Institute,1956     **California.
