Piegl,Hayong Shin,2011-04-11 In the last decade signi cant changes have occurred in the eld of vehicle motion planning and for UAVs in particular UAV motion planning is especially dif cult due to several complexities not considered by earlier planning strategies the creased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and dif culty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is dif cult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle eld A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data *Proceedings* ,1997 20th DASC ,2001 Engineering News-record ,1986 **Scientific and Technical Aerospace Reports** ,1992 Detection Technologies for Mines and Minelike Targets Abinash C.
