## Finding Phenotypes and Genotypes for One Trait

In genetics, understanding dominance and recessive traits allows us to predict the inheritance of traits. For example, in pea plants, the trait for seed shape (round vs. wrinkled) is determined by a single gene with two alleles. If a plant has two dominant alleles (RR), it will have round seeds. If it has one dominant and one recessive allele (Rr), it will also have round seeds. If it has two recessive alleles (rr), it will have wrinkled seeds. This understanding helps us determine the genotype of a plant based on its phenotype.

When we cross two heterozygous plants (Rr x Rr), we can predict the possible genotypes and phenotypes of the offspring. The Punnett square shows that there is a 75% chance of round seeds and a 25% chance of wrinkled seeds. This is because the dominant allele (R) masks the recessive allele (r).

For the following problems, you will:

1. Identify the dominant and recessive traits.
2. Determine the genotype of the parents.
3. Use a Punnett square to predict the possible genotypes and phenotypes of the offspring.
4. Calculate the probability of a specific trait appearing in the offspring.

Problem 1:  
Round seeds (R) is dominant over wrinkled seeds (r).

Parent 2:

Problem 2:

Round seeds (R) is dominant over wrinkled seeds (r).

What is the probability of a round seed offspring from a cross of two heterozygous parents (Rr x Rr)?
